

PRO-2, CLEAN, DRY & PROOF ...for all varieties in awning fabrics...

Clean but unproof does not help anybody! Our conditioning-program for covers and spray hoods always includes the application of a new, strong and lasting impregnation.

Thoroughly in- and outside cleaning

See your spray hood or cockpit tent as the visiting card of your ship. It will be the first thing seized of your boat, it's through here, that you enter the interior. Below moulded, fatty and dirty fabric roofs, that already release fusty odours, a well being cannot establish. These aesthetic and hygienic aspects are accommodated in our cleaning and conditioning processes.

Experience in maintaining heavily stressed awnings

In our Scandinavian climate awnings are stressed to a maximum. The long summer days respectively nights are a non stop UV exposure. The fabrics never dry really, in cool nordic nights a big amount of humidity builds up on the outside and causes an above average of condensed water on the inside. Since this humidity never gets the chance to dry away, mould builds up quickly. Kooking vapours and the integrated fats let the cover quickly be cultivated by bacteria, mildew and fungi. The cloth goes grey and fatty: Maintenance is mandatory!

Attention: When you stop, our jobs start

When your sailing season stops, our jobs really start. Please supply your covers and sails as early as possible for treatment, still in autumn, immediately after your boat has been winter stored. We have to work ourselves through big quantities of covers and sails. The earlier we get yours, the earlier you will have them back.

PRO² Cover Conditioning

Awnings & spray hoods, as new: Protection & well being

Exterior of an awning, in an before-after comparison

Left cleaned, note the revitalisation of the colours
Right, moulds, algae but mostly old environmental pollutions

Interior of above awning in different stades of cleaning:

Top: mould, fatt and pollutions
Below left: resistant mould | Below right: fully cleaned

Impregnation for a long term protection against humidity:

In the picture: Hydrophobic effects, water drops combined with pools of water on the fully proofed awning

The PRO-2 Cover Conditioning is a reevaluation of your cover. Cockpit tents and spray hoods must be protective, they keep you dry and water and wind off. We strengthen your cover by an special impregnation, that contributes also to aesthetics and rejects water and dirt. Together with a colour intensification, you will be well living under it.

Cleaning

At first pollutions will be soaked in a chemical bath and the loose dirt rinsed off. At second, resistant pollutions and mould will be removed. The big variety of possible pollutions makes an individual treatment per cover a necessity. Our manual cleaning procedures are designed for this.

Our superior cleaning performance has also a technical background: without this, our impregnation cannot bond properly and in consequence develop its properties and longevity.

Mould & mildew removal

To us, covers are only clean when they are free of mildew. Unfortunately moulds are not a pollution but an affection or incrustation of fouling matter and fungi, that is capable to survive even harsh cleaning methods and spread out again.

Duration of a Conditioning process

The RED GULL PRO-2 Cover Conditioning-process, is a manual treatment, in which every cover or spray hood will be worked manually several times, side by side, with regular dryings in-between. This can take 2- 4 days.

Treatment process

All processes take place under permanent supervision, allowing us an individual treatment of your cover or spray hood. Working your cover manually and individually, acc. its fabrics needs, allows us to eliminate the disadvantages of single process machine treatments. This enables us also to maintain the fabrics actual fabric tension and structure through out our processes.

Related to the big variety of awning materials, qualities of these and their actual conditions, we are unfortunately forced to formulate some liability limitations.

Despite a maximum of efforts, we cannot guarantee, that:

- moulds are removed fully and will not reappear
- no discolourations will appear
- colours will be for 100 % as new
- discolourations caused by bird and gull droppings will revitalize
- windows will not go dim or cloudy
- old and damaged awnings will still goe proof
- all pollutions are removable
